Raymond Jones

(850) 329-8449 | raymond@raymondjones.dev | https://www.linkedin.com/in/therealraymondjones/ | San Francisco

SKILLS

Programming: Java, Python, Javascript, MySQL
Database/Frameworks: AWS(EC2, S3, Lambda, DynamoDB, SQS), MySQL, Angular, React
CI/CD: Jenkins, Maven, Kubernetes, Docker
Tools: Grafana, Kibana, OpenObserve, Vim, Unix, Linux

WORK EXPERIENCE

Walmart - Backend Software Engineer *March 2025 - Present*

- Used Java and Spring to implement features within Last Mile Delivery, assisting Walmart online orders through calculating prices within a scalable distributed system that generates $1 billion/year
- Performed Azure CosmosDB query optimization to save $60,000/year on cloud costs and increase speed of queries by 100%
- Design and integrated guardrails for agentic ai integration in microservice REST api routes for project estimated to save $1,000,000 for business operations
- Improved application robustness within microservices by deprecating attributes within Azure CosmosDB and servers and adding unit tests and regression tests in multi-phase roll outs
- Implemented dynamic pricing logic based on demand, driver supply, distance, and market conditions across 100,000+ active deliveries
- Root-caused a non-deterministic pricing defect by identifying shared mutable state across a multi-tenant Java service, redesigning object initialization to restore request isolation and pricing correctness.

Software Engineer *June 2023 - March 2025*

Client: Starpoint Law (Client)

- Architected and designed AI-based tools for law firms, including a medical report debriefer and an automatic case update system, enhancing client communication efficiency and reducing manual data processing time by 50%
- Utilized extensive experience in Python and AWS DynamoDB to ensure scalability, maintainability, and robustness and HIPAA compliance.
- Delegated tasks to junior developers for Lambda function creation and API integrations, optimizing workflows and ensuring scalable solutions for client-specific projects.

Client: Dylan Curt (Contract)

- Led the development of a gamified language learning platform, employing AWS DynamoDB to optimize for high-frequency read operations and scalability and React / Javascript for front-end.
- Utilized extensive experience in Python, Django, and DynamoDB to ensure scalability, maintainability, and robustness. Also used PyUnit to aid in this.
- Created a 300% increase in data retrieval speed and accommodated a user base growth of 250% within the first six months post-launch.
- Architected serverless microservices using AWS Lambda and API Gateway, reducing server response times by 40% and cutting operational costs by 30%, while allowing up to 1,000 requests per minute during peak usage.

Client: Inspired Funding (Contract)

- Rapidly developed API System using Python, Django, and React, integrating technologies like AWS Lambda and Docker for efficient deployment with DynamoDB
- Designing server APIs with AWS API Gateway to create strong microservice communication
- Encrypting user data using GPG, S3, and KMS to improve data security by 100%
- Architected scalable web applications able to support 1000 concurrent users

- Mastered Vim for code editing, increasing development speed and efficiency by 25% through the use of advanced text manipulation, leading to faster turnaround times for project deliverables.

Easypost – Back End Software Engineer *April 2022 - June 2023*

- Boosted Canada Post shipment tracker reliability by 20% by implementing caching and API idempotency with Python and Redis
- Built MySQL queries to fix Veho trackers for 300+ users, leading to 50% improvement in service
- Strengthened tests using PyUnit to build tests and mock functions. Used Grafana in debugging
- Collaborated to fix serious bugs, maintaining a 95% completion rate for incoming tickets
- Utilized Kubernetes to organize containers and improve microservice uptime with Docker

Citibank – Full Stack Software Engineer *June 2020 - April 2022*

- Refined speed of Angular / Javascript page by 5 seconds by using algorithm knowledge, developer tools, and analyzing code base of 1000+ lines.
- Designed regression automation test suites with Selenium to reduce manual testing time by 60%, saving $10,000+ on developer time.
- Developed components and utilized data binding in Angular to deploy features for users
- Utilized Reducers and Context in React / Javascript to display user data
- Reduced technical debt by 30% by updating Java packages and removing dependencies in various projects

Ray Digital – Front End Web Developer **June 2019 - April 2020**

Client: GatorPlacer (Contract)

- Worked with a client and team of 5 to develop an app that allows students to view a professor's courses, information, and location on a map.
- Using Javascript frameworks Angular and MVC model, contributed to 50% of Front-End code
- Implemented design optimizations which improved page load speed by 45% using binary search
- As Scrum Master, directed 20+ meetings by discussing client/software needs resulting in 30% increase in group participation and development.
- Built robust RESTful API using Javascript framework Node.js and Express.js, ensuring seamless client-server interactions

Client: Law Firm (Contract)

- Used HTML, CSS, and Javascript to develop websites for clients.
- Leveraged asynchronous programming with Promises, async / await, and the fetch API for efficient data fetching and handling.

EDUCATION

B.S in Computer Science, University of Florida

LANGUAGES

English (Native), Spanish (Fluent)
